

LISA Centralised cross-connects

Highest patching density

The LISA fiber management system accommodates up to 1500 mated ports per rack. The number of ports can be doubled when two racks are placed back-to-back on a single floor tile.

Fast identification

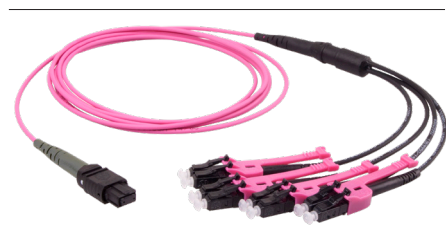

Colour-codable cassettes and clear port numbering improve the identification of circuits and speed up provisioning time.

Simplified MACs

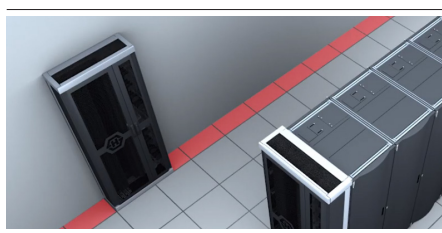

The sliding cassettes and the sophisticated cable routing simplify the installation and reduce the servicing time.

Pre-terminated cable systems

Optipack cable systems are compact, flexible and robust. Trunk cables, harnesses and jumpers provide end-to-end plug-and-play solutions to suit all data center needs.

Optimisation of your investment

The small footprint of the LISA racks saves valuable floor space in the data center.

Total cost of ownership

The high packing density of the LISA system reduces the total cost of ownership and allows valuable rack space to be occupied with revenue generating active equipment.
