

IANOS® High-density connectivity system

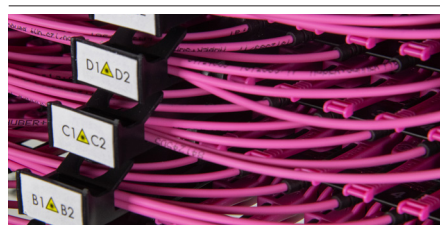

11.2019

Unbeatable flexibility

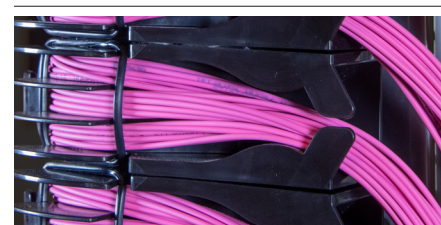

With its high degree of flexibility, IANOS provides a better return on investment and better utilisation of existing assets whilst still supporting a pay-as-you-grow concept.

Highest patching density

The IANOS chassis facilitates fast and seamless patching of 72 LC/MTP® ports per 1 U height.

Smart cable management

The system integration of the cable management allows a quick and easy installation and ensures an excellent organisation of the fibers.

Total cost of ownership

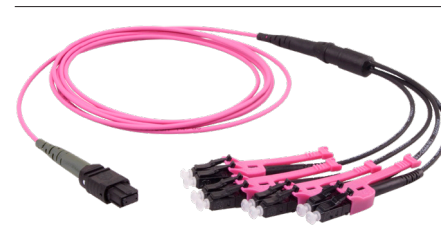

The high packing density of IANOS reduces the total cost of ownership and allows valuable rack space to be occupied with revenue generating active equipment.

Upgradeable and future-proofed

Transition modules using MTP® connectivity allow users to build an upgradeable backbone suitable for 40G, 100G or 400G while supporting all backbone types including Base-8.

Pre-terminated cable systems

Optipack cable systems are compact, flexible and robust. Trunk cables, harnesses and jumpers provide end-to-end plug-and-play solutions to meet all data center requirements.
